## Environmental Product Declaration – Aquapon WB EP<sup>®</sup> Interior Epoxy

Aquapon WB EP<sup>®</sup> Interior Epoxy is the next generation of water-based epoxy technology that gives you excellent performance in abrasion, chemical and corrosion resistance. This durable and stain-resistant finish protects both floor and vertical surfaces in healthcare, education and industrial facilities. With fast recoat times, your facility maintenance schedules are shortened with limited usage interruption. *Aquapon WB EP* is available in both standard and custom-tinted colors. Visit <u>ppgpmc.com</u> for more information.

The product image to the right is an example of one of the formulas covered by the EPD. A list of all relevant Aquapon WB EP formulas is shown in Table 1 in this EPD.

In order to support comparative assertions, this EPD meets all comparability requirements stated in ISO 14025:2006. However, differences in certain assumptions, data quality, and variability between LCA data sets may still exist. As such, caution should be exercised when evaluating EPDs from different manufacturers, as the EPD results may not be entirely comparable. Any EPD comparison must be carried out at the building level per ISO 21930 guidelines. The results of this EPD reflect an average performance by the product and its actual impacts may vary on a case-to-case basis.

### **Product Definition, Characteristics and Specifications:**

Aquapon WB EP<sup>®</sup> is a two component, ultra-low VOC, water-based epoxy finish suitable for both floors and vertical surfaces. Its performance characteristics are impact, mar, and abrasion resistance; breathability; low odor; soap and water cleanup; stain resistance and low VOC content. *Aquapon WB EP* meets MPI 115 and 215 specifications for water-based epoxy modified latex paints. Products included in this study comprise 16 two-part epoxy coatings based on 13 in-the-can products (9 "Part A" resins and 4 "Part B" cure/hardeners) from PPG's *Aquapon WB EP* product line. The as-applied mixed products are listed in Table 1, together with their component product numbers.

EPD Product Name	Part A (Product number in parentheses)	Part B (Product number in parentheses)	Volume mixing ratio
WHITE - GLOSS	WHITE (98E-1)	CURE (98E-98)	4:1

The manufacturing process for architectural coatings primarily involves the mixing and dispersing of raw materials into a homogeneous mixture. Raw materials include *pigments and fillers*, which provide color, hiding, and gloss control; *resins/binders*, which dry to form a solid film and adhere the coating to the substrate; *water*, which acts as a thinner and carrier; and *additives*, which assist with various coating properties. The product is then packaged for distribution to the customer. The typical composition of an *Aquapon WB EP* coating is shown by % weight in Table 2 along with simplified version of this process shown in Figure 1. Components of *Aquapon WB EP* products considered to be hazardous as listed on Safety Data Sheets (SDS) are listed along with their quantities and CAS numbers in Table 3. Note that all of these hazardous substances may not exist in any single product, and that the percentages given are calculated on the in-the-can Part A and Part B formulas.

Ingredient category	% of product by weight
Additives	5-8%
Preservatives	0-1%
Binders	22-34%
Fillers	0-20%
Glycols, esters, ethers	2-4%
Pigments	0-7%
Solvents	0-1%
Titanium dioxide	0-19%
Water	41-56%

Zinc oxide	≤1.9	1314-13-2

### Life Cycle Assessment Methodology:

### Calculation of quantities needed to satisfy the functional unit:

In accordance with the Product Category Rule (PCR) for Resilient Floor Coatings, this EPD is based on a cradle-to-grave LCA, and the functional unit for the study is defined as  $1 \text{ m}^2$  of covered and protected substrate for a period of 60 years (the assumed average lifetime of a building). The PCR requires separate analyses for a market-based service lifetime and a technical service lifetime for the coating product. *Aquapon WB EP* is considered a "thin-mil floor coating" by the PCR and is marketed for use in both commercial and industrial facilities. Therefore, the service lifetime criteria for both commercial and industrial uses have been calculated. For commercial uses, the prescribed technical lifetime is 15 years for thin-mil floor coating to Aquapon WB EP product literature, the desired coating thickness is 2 to 4 mils and the spreading rate is 8.3 m<sup>2</sup>/L for a 2-mil thickness. A 3-mil average coat thickness and a corresponding spreading rate of 6.2 m<sup>2</sup>/L has been assumed throughout this report. Two coats for each initial application and replacement coating are assumed. Table 4 summarizes the calculation of quantities for each formula used in the LCA.

Following the PCR, for any coating that can accept colorant, it was assumed that the full allowable amount of colorant is added to the paint either at the point of sale or application site. The tint/colorant inventory was taken from the GaBi carbon black pigment data (furnace black; deep black pigment - Revised 11/30/2014) in the appropriate quantity specified for the type of coating base for the respective Aquapon WB EP product. The amount of colorant needed for each formula is shown in Table 4, and its impact is included in the overall LCA results.

### Allocation:

In the LCA model, the only allocation used was a mass-based allocation during the manufacturing process, to assign PPG manufacturing plant inputs and outputs across multiple products produced at the same plant.

### System Boundary:

Informational modules from ISO 21930:2017 included in and excluded from the analysis, in accordance with the PCR, are shown in Table 5. The system process flow diagram is shown in Figure 2. Items shown outside the system boundary in Figure 2 were excluded from the assessment in accordance with the PCR. No benefits beyond the system boundary (optional module D) are included.

### Criteria for the inclusion of inputs and outputs:

All components of the coating formulations which comprised more than 0.1% of the manufactured product were included in the study. The models were constructed to meet the minimum of 95% of the total mass, energy, and environmental relevance of the system, except for items excluded from the study as specified in the PCR.

### Table 5 – ISO 21930 Information modules covered in this analysis

Checked box = Module used in this analysis (unchecked = not used)

### Additional information relevant to the analysis:

Additional information used in the analysis are summarized in Table 6 as well as the following:

- Module A2: Transportation impacts are calculated for the total mass of raw materials, including wastage, minus the amount of water added at the plant, which varies with each formulation.
- Module A3: All Aquapon WB EP products are made at PPG's East Point, GA plant. Plant energy and water usage, waste generation and environmental emissions are assigned to the products based on the total mass of all output from the plant.

- Module B2: In accordance with the PCR, cleanings are performed daily with a mop-and-bucket solution, resulting in a total of 220 gallons of water used for the functional unit. A cleaning solution is used at a specified dilution rate given in the PCR at ½ cup (4 oz) per gallon. However, a concentrated, "green" cleaning solution was chosen for this analysis, with a manufacturer-recommended dilution rate of ½ to 2 oz per gallon. The dilution rate was modeled as 1 oz/gallon as shown in Table 6.
- Module B4: As specified in the PCR, all replacement coats, including modules A1-A5 for each coat, are included in this module. This resulted in a range of 3 to 11 times the original mass being used Module B4, depending on the service lifetime used.

Scenario	Parameter or Scenario description	Units	Value

### Table 6 - Scenarios, parameters and other technical information used in the analysis

Notes: (1) Hereafter the same unless noted otherwise; (2) ecoinvent defaults, (3) As specified in the PCR, (4) Best estimate.

### Life Cycle Impact Assessment Methodology:

The Life Cycle Impact Assessment (LCIA) step of the analysis groups emissions and resource consumption into categories by known environmental impacts to which they contribute, and applies characterization factors to calculate the relative importance of each substance in a category. The U.S.-based TRACI 2.1 (Bare 2011) method was used to calculate the impacts in the following impact categories, in accordance with the PCR:

- Climate change or global warming potential (GWP 100 years) [kg CO<sub>2</sub>-eq.]
- Acidification potential of land and water sources (AP) [kg SO<sub>2</sub>-eq]
- Photochemical ozone creation potential (POCP, or "Smog Formation") [kg O<sub>3</sub> eq.]
- Eutrophication potential (EP) [kg N eq.]
- Stratospheric ozone depletion potential (ODP) [kg CFC-11 eq.]

Additional life cycle inventory results reported in accordance with the PCR, using the EN15804 method with the exception of the "energy carrier" metrics are the following:

- Non-Renewable Primary Resources Used as an Energy Carrier [MJ]
- Non-Renewable Primary Resources with Energy Content Used as a Material [kg]
- Renewable Primary Resources Used as an Energy Carrier [MJ]
- Abiotic Depletion Potential for Fossil Resources Used as Energy [MJ]
- Abiotic Depletion Potential for Fossil Resources Used as Materials [kg]
- Consumption of Freshwater [m<sup>3</sup>]
- Hazardous waste [kg] as defined by RCRA under 40 CFR 261.33
- Non-hazardous waste [kg]
- Radioactive waste [kg]. All radioactive waste is assumed to be high-level radioactive waste, given the limitations of the method.

The following additional categories are required to be evaluated by ISO 21930:2017, but were analyzed and all results were determined to be zero, and are therefore excluded from the charts and tables:

- Renewable Primary Resources with Energy Content Used as a Material [kg]
- Recovered Energy from disposal of waste in previous systems –[MJ]
- Additional product attributes including components for reuse, materials for recycling, materials for energy recovery, or recovered energy from the product system
- Secondary materials, renewable and non-renewable secondary fuels
- All biogenic carbon uptake and emissions, or those from carbonation, in accordance with Section 13F of the PCR.

To fulfill the requirement of Section 13G1-G5 of the PCR, the Cumulative Energy Demand (CED) v1.11 method was used to recalculate the Non-Renewable Primary Resources Used as an Energy Carrier [MJ] and Renewable Primary Resources Used as an Energy Carrier [MJ] categories, so that each could be subdivided into Fossil, Nuclear, Hydroelectric, Bio-, Wind and Other energy sources (Note that this method includes the Other sources Solar and Geothermal in a combined category with Wind). The metrics listed by Section 13G6-G12 of the PCR overlap with the other categories listed above.

Optional LCIA categories related to human health and environmental toxicity were not included in this analysis.

### Life Cycle Assessment Results:

The total LCA results for each formulation are shown numerically for the technical, market and industrial service lifetimes in Table 7, Table 8 and Table 9, respectively. Table 10 shows the worst case results (maximum impact in each category for the entire range of products) for LCI categories by module, and Table 11 shows worst case results for LCIA categories by stage, except modules B2 and B4, which are broken out by module to highlight their individual contributions. Average results for all products included in this EPD are shown graphically for the technical service lifetime in Figure 3. Results for individual products are not expected to differ substantially from the results shown above.

Relative contributions normalized to total impact of product with highest total impact in this category

# Figure 3 - Graphical impacts for the average *Aquapon WB EP* product showing % contribution by life cycle stage

### Limitations and Data Gaps:

No significant data gaps are believed to exist within the primary datasets collected for this analysis, or within the stated system boundaries. However, as noted in the PCR, significant data limitations currently exist within the LCI data used to generate waste metrics for Life Cycle Assessments and Environmental Product Declarations. The waste metrics were calculated in a way conformant with the requirements of ISO 21930:2017, but these values represent rough estimates and are for informational purposes only. As

such, no decisions regarding actual cradle-grave waste performance between products should be derived from these reported values.

### Emissions to Water, Soil, and to Indoor Air:

Because coatings are a passive product during use, the only impacts occurring during this phase are generally due to the off-gassing of material components in the paint. The VOC content of *Aquapon WB EP* products is calculated per US EPA Method 24. Colorants added to the base paints may increase the VOC level significantly depending on color choice. PPG offers a low VOC line of colorants which, if used even at maximum tint load in any color, contributes less than 8 g/L of VOC to the final tinted product.

### **LCA Interpretation**

The LCA results show that the raw materials (Modules A1 for initial coats and B4 for replacement coats) tend to contribute highly to the impact of many indicators. This high contribution of raw materials to the impact indicators is not unexpected. As paints are primarily mixtures of pre-processed ingredients, much of the expenditure of energy, raw materials, processing, waste processing, etc. in bringing the product to existence has occurred prior to the entry of the raw materials onto the PPG production site. The majority of the impact of the raw materials comes from the titanium dioxide and the binder. This is typical for coatings products since these two raw materials are often present in high proportions and have a relatively high processing energy demand. The daily cleaning process specified by the PCR also contributes significantly to the impact in many categories.

### Additional Environmental Information:

### Preferred End-of Life Options:

Please visit <u>www.paintcare.org</u> for information about disposing unused latex paint. If possible, unused paint should be taken to an appropriate recycling/take-back center or disposed of in accordance with local environmental regulatory agency guidance.

### **Data Quality Assessment:**

To assess the input quality of the specific product data used in the LCA modeling, the pedigree matrix developed by Weidema and Wesnaes (1996) was used. The pedigree matrix rates data on a scale of 1 to 5 (1-poor, 2-fair, 3-good, 4-very good, 5-excellent) for each of 5 rating criteria: reliability of source, completeness, temporal correlation, geographical correlation, and technological correlation. Primary data for the year 2015 was obtained from PPG environmental reporting systems dealing with manufacturing plant operations. When primary data was for processes not directly under PPG's control, data was taken from the ecoinvent v3.1 database. ecoinvent is widely accepted by the LCA community. The regional U.S. electric power grid generation mix for each plant was used in the LCA model according to the percentage of product made at that plant. The primary data is considered to be of excellent quality and ecoinvent very good. Because the transportation, application and disposal stages contained several assumptions specified in the PCR, these stages received a minimum score of good. Considering that the majority of environmental impact is in the stages for which the data was of higher quality, the overall data quality rating was assessed as Very Good.

### **Glossary:**

### Acronyms & Abbreviated Terms:

- ACA: American Coating Association
- ASTM: A standards development organization that serves as an open forum for the development of international standards. ASTM methods are industry-recognized and approved test methodologies for demonstrating the durability of an architectural coating in the United States.
- ecoinvent: a life cycle database that contains international industrial life cycle inventory data on energy supply, resource extraction, material supply, chemicals, metals, agriculture, waste management services, and transport services.
- EPA WARM model: Unite States Environmental Protection Agency Waste Reduction Model.
- EPD: Environmental Product Declaration. EPDs are form of as Type III environmental declarations under ISO 14025. They are the summary document of data collected in the LCA as specified by a relevant PCR. EPDs can enable comparison between products if the underlying studies and assumptions are similar.
- GaBi: Created by PE INTERNATIONAL GaBi Databases are LCA databases that contain ready-to-use Life Cycle Inventory profiles.
- LCA: Life Cycle Assessment or Analysis. A technique to assess environmental impacts associated with all the stages of a product's life from cradle to grave (i.e., from raw material extraction through materials processing, manufacture, distribution, use, repair and maintenance, and disposal or recycling).
- NCSS: NSF International's National Center for Sustainability Standards
- PCR: Product Category Rule. A PCR defines the rules and requirements for creating EPDs of a certain product category.
- TRACI: Tool for the Reduction and Assessment of Chemical and Other Environmental Impacts.
- VOC: Volatile organic compounds

### Terminology from the PCR:

- Architectural coating: a coating recommended for field application to stationary structures or their appurtenances at the site of installation, to portable buildings, to pavements, or to curbs. For purposes of the PCR an 'architectural coating' does not include adhesives and coatings for shop applications or original equipment manufacturing, nor does it include coatings solely for application to non-stationary structures, such as airplanes, ships, boats, and railcars. Please see the product category requirements in Section 1.1 of the PCR. General architectural coatings are decorative or protective paints or coatings formulated for interior or exterior architectural substrates including, but not limited to: drywall, stucco, wood, metal, concrete, and masonry. Primers, sealers and undercoaters are coatings formulated for one or more of the following purposes: to provide a firm bond between the substrate and the subsequent coatings; to prevent subsequent coatings from being absorbed by the substrate; or to prevent harm to subsequent coatings by materials in the substrate; or to provide a smooth surface for the subsequent application of coatings; or to provide a clear finish coat to seal the substrate; or to prevent materials from penetrating into or leaching out of a substrate. Interior architectural coatings that meet the product category requirements in section 1.1 of the PCR and that are applied to substrates that primarily reside in interior.
- <u>Biologic growth or bio deterioration</u>: any undesirable change in material properties brought about by the activities of microorganisms.
- <u>Blistering</u>: the formation of dome shaped hollow projections in paints or varnish films resulting from the local loss of adhesion and lifting of the film from the surface or coating.
- <u>Burnish resistance</u>: the resistance of a coating to an increase in gloss or sheen due to polishing or rubbing.
- <u>Design life</u>: The estimated lifetime of a coating based solely on its hiding and performance characteristics determined by results in certain ASTM durability tests.
- <u>Durability</u>: the degree to which coatings can withstand the destructive effect of the conditions to which they are subjected and how long they retain an acceptable appearance and continue to protect the substrate.
- <u>Erosion</u>: the wearing away of the top coating of a painted surface e.g., by chalking, or by the abrasive action of windborne particles of grit, which may result in exposure of the underlying surface. The degree of resistance is dependent on the amount of coating retained.
- <u>Flaking/Peeling</u>: the phenomenon manifested in paint films by the actual detachment of pieces of the film itself either from its substrate or from paint previously applied. Peeling can be considered as an aggravated form of flaking. It is frequently due to the collection of moisture beneath the film.
- <u>Gloss</u>: a value of specular reflection which is often used to categorize certain types of paints.
- <u>Intermediate processing</u>: the conversion of raw materials to intermediates (e.g. titanium dioxide ore into titanium dioxide pigment, etc.).
- <u>Market-based life</u>: The estimated lifetime of a coating based off the actual use pattern of the product type. In this instance, a repaint may occur before the coating fails.
- <u>Pigment</u>: the material(s) that give a coating its color.
- <u>Primary materials</u>: resources extracted from nature. Examples include titanium dioxide ore, crude oil, etc. that are used to create basic materials used in the production of architectural coatings (e.g., titanium dioxide).
- <u>Resin/Binder</u>: acts as the glue or adhesive to adhere the coating to the substrate.
- <u>Scrubbability</u> or scrub resistance: the ability of a coating to resist being worn away or to maintain its original appearance when rubbed repetitively with an abrasive material.
- <u>Secondary materials</u>: recovered, reclaimed, or recycled content that is used to create basic materials to be used in the production of architectural coatings.
- <u>Washability</u>: the ease with which the dirt can be removed from a paint surface by washing; also refers to the ability of the coating to withstand washing without removal or substantial damage.
